

# STL SET C++ ITERATORS QUEUE ADT

---

Problem Solving with Computers-II

C++

```
#include <iostream>
using namespace std;

int main(){
    cout<<"Hola Facebook!n";
    return 0;
}
```

GitHub

## Iterators: Standard way to iterate through containers

```
template <class T>
void printKeys(T& t) {
    for(auto item : t){
        std::cout << item <<" ";
    }
    cout<<endl;
}
```

```
vector<int> v {30, 20, 25, 40, 35, 60};
```

```
set<int> s {30, 20, 25, 40, 35, 60};
```

# Iterating through a vector using pointers

- Let's consider how we generally use pointers to parse an array or vector

```
void printKeys(vector<int>& t) {  
    int *p = &(t[0]);  
    for(int i = 0; i < t.size(); i++) {  
        cout << *p <<" ";  
        ++p;  
    }  
}
```

<b>30</b>	<b>20</b>	<b>25</b>	<b>40</b>	<b>35</b>	<b>60</b>
-----------	-----------	-----------	-----------	-----------	-----------

- We would like our print “algorithm” to also work with other data structures e.g. linked list or BST

## Iterating through set: first try

```
void printKeys(set<int>& t) {  
    int *p = &(t[0]);  
    for(int i = 0; i < t.size(); i++) {  
        cout << *p <<" ";  
        ++p;  
    }  
}
```

Does the above code work? Why or Why not?

- A. It works if the set class overloads the \* and ++ operators
- B. It works if the set class overloads the [] operator
- C. It doesn't work because elements of the BST are not contiguous in memory
- D. It doesn't work because <fill in your reason>

## Iterating through set: first try

```
void printKeys(set<int>& t) {  
    set<int>::iterator p = t.begin();  
    for(int i = 0; i < t.size(); i++) {  
        cout << *p <<" ";  
        ++p;  
    }  
}
```

The variable `p` is an iterator (a class that stores a simple pointer to a BST node)

A. It works because **set** iterator class overloads the `*` and `++` operators

Allowing a standard way to iterate through the elements of set (in order)

## Iterating through set using the set<T>::iterator

```
void printKeys(set<int>& s) {  
    set<int>::iterator it = s.begin();  
    set<int>::iterator en = s.end();  
    while(it!=en){  
        cout << *it <<" ";  
        it++;  
    }  
    cout << endl;  
}
```

## C++ shorthand: auto

```
void printKeys(set<int>& s) {  
    auto it = s.begin();  
    auto en = s.end();  
    while(it != en){  
        cout << *it <<" ";  
        it++;  
    }  
    cout << endl;  
}
```

## Finally: unveiling the range based for-loop

```
template <class T>
void printKeys(T& t){
    for (auto item : t){
        cout << item << " ";
    }
    cout << endl;
}
```

The range-based for loop is just a shorthand for code that uses iterators.

Activity (2 min) Write the expanded version of the printKeys() function using iterators

*Note that not all containers have iterators. For example the same code would not work with stack, queue, or priority\_queue*

# Queue

- A queue is like a queue of people waiting to be serviced
- The queue has a **front** and a **back**.

# Queue Operations: push, pop, front, back

New people must enter the queue at the back. The C++ queue class calls this a push operation.

# Queue Operations: push, pop, front, back

- When an item is taken from the queue, it always comes from the front. The C++ queue calls this a pop

# Queue class

- The C++ standard template library has a queue template class.
- The template parameter is the type of the items that can be put in the queue.

```
template <class Item>
class queue<Item>
{
public:
    queue( );
    void push(const Item& entry);
    void pop( );
    bool empty( ) const;
    Item front( ) const;
    Item back( ) const;

};
```

# Breadth first traversal

- Create an empty Queue.
- Start from the root, insert the root into the Queue.
- Now while Queue is not empty,
  - Extract the node from the Queue and insert all its children into the Queue.
  - Print the extracted node.

Reminder: Please fill course and TA mid quarter evaluations
