STANDARD TEMPLATE LIBRARY STACKS

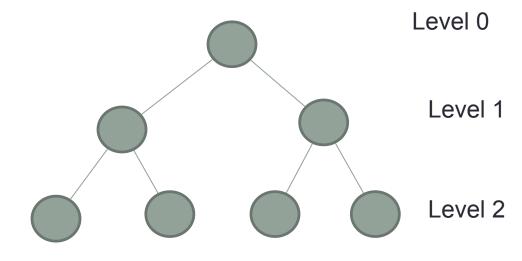

Problem Solving with Computers-II

Announcements

• Midterm Review session 5p - 7p Monday(today) in HFH 1132

Height of a completely filled tree

Finally, what is the height (exactly) of the tree in terms of N?

Balanced trees

- Balanced trees by definition have a height of O(log N)
- A completely filled tree is one example of a balanced tree
- Other Balanced BSTs include AVL trees, red black trees and so on
- Visualize operations on an AVL tree: https://visualgo.net/bn/bst

C++STL

- The C++ Standard Template Library is a very handy set of three built-in components:
 - Containers: Data structures
 - Iterators: Standard way to search containers
 - Algorithms: These are what we ultimately use to solve problems

C++ STL container classes

```
array
                     vector
               forward list
                       list
                        set
                      stack
                      queue
            priority queue
multiset (non unique keys)
                      deque
             unordered set
                        map
             unordered map
                   multimap
                     bitset
```

Stacks – container class available in the C++ STL

- Container class that uses the Last In First Out (LIFO) principle
- Methods
- i. push()
- ii. pop()
- iii. top()
- iv. empty()

Lab05 – part 1: Evaluate a fully parenthesized infix expression

```
(4*((5+3.2)/1.5))// okay
(4 * ((5 + 3.2) / 1.5) // unbalanced parens - missing last ')'
(4 * (5 + 3.2) / 1.5)) // unbalanced parens - missing one '('
4 * ( (5 + 3.2 ) / 1.5 ) // not fully-parenthesized at '*' operation
(4 * (5 + 3.2) / 1.5) // not fully-parenthesized at '/' operation
```

$$((2*2)+(8+4))$$

Initial empty stack

Read and push first (

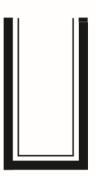

Read and push second (

$$((2*2)+(8+4))$$

Initial empty stack

Read and push first (

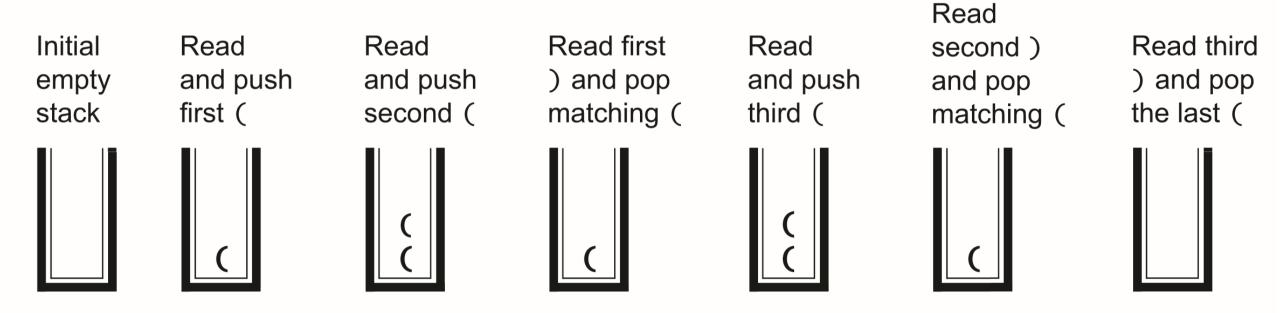

Read and push second (

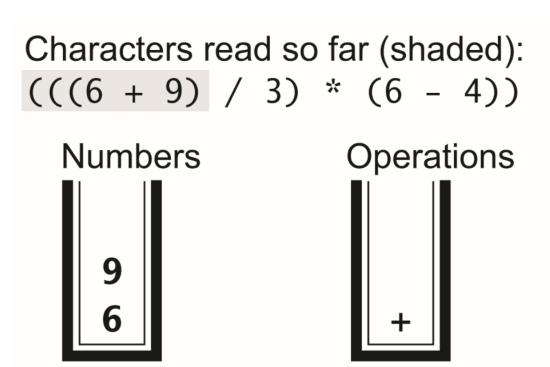

What should be the next step after the first right parenthesis is encountered?

- A. Push the right parenthesis onto the stack
- B. If the stack is not empty pop the next item on the top of the stack
- C. Ignore the right parenthesis and continue checking the next character
- D. None of the above

$$((2*2)+(8+4))$$

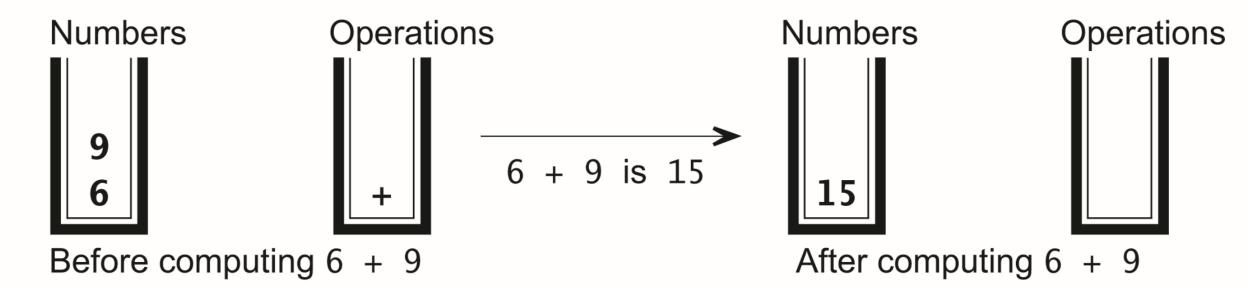

$$(((6 + 9)/3)*(6 - 4))$$

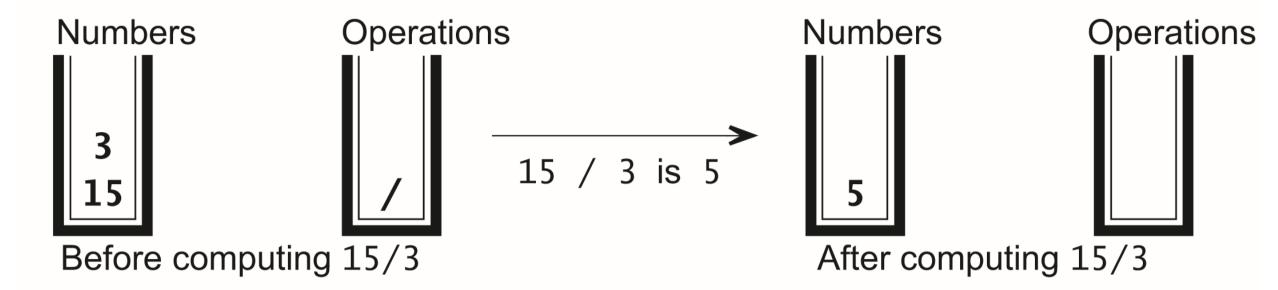

Characters read so far (shaded):

$$(((6 + 9) / 3) * (6 - 4))$$

Characters read so far (shaded):

$$(((6 + 9) / 3) * (6 - 4))$$

Notations for evaluating expression

- Infix number operator number
- (Polish) Prefix operators precede the operands
- (Reverse Polish) Postfix operators come after the operands

```
3 * 5
4 / 2
7 + (3 * 5)
(7 + (3 * 5)) - (4 / 2)
```

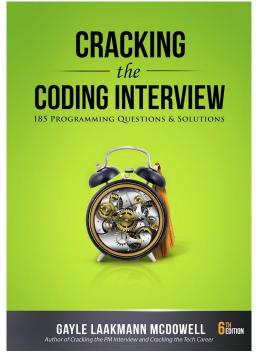

Lab 05, part2: Evaluating post fix expressions using a single stack

Postfix: 735*+42/- Infix: (7+(3*5))-(4/2)

Small group exercise

Write a ADT called in minStack that provides the following methods

- push() // inserts an element to the "top" of the minStack
- pop() // removes the last element that was pushed on the stack
- top () // returns the last element that was pushed on the stack
- min() // returns the minimum value of the elements stored so far

Summary of operations

Operation	Sorted Array	Binary Search Tree	Linked List
Min			
Max			
Median			
Successor			
Predecessor			
Search			
Insert			
Delete
